- This is an instance of distributed constrained optimization problems which represent several real-world problems, where instead of amount of time agents should decide over time of a meeting, amount of energy, ...

Introduction Distributed Constraint Reasoning Applications and Exemplar Problems Complete algorithms for DCOPs Approximated Algorithms for DCOPs Conclusions	
Constraint Networks	

A constraint network \mathcal{N} is formally defined as a tuple $\langle X, D, C \rangle$ where:

- $X = \{x_1, \ldots, x_n\}$ is a set of discrete variables;
- $D = \{D_1, \dots, D_n\}$ is a set of variable domains, which enumerate all possible values of the corresponding variables; and
- $C = \{C_1, \ldots, C_m\}$ is a set of constraints; where a constraint C_i is defined on a subset of variables $S_i \subseteq X$ which comprise the scope of the constraint
 - $r = |S_i|$ is the arity of the constraint
 - Two types: hard or soft

◆□▶ ◆□▶ ▲ = ▶ ▲ = ● ◆ ○ ◆ ○ ◆

Hard constraints

• A hard constraint C_i^h is a relation R_i that enumerates all the valid joint assignments of all variables in the scope of the constraint.

$$R_i \subseteq D_{i_1} imes \ldots imes D_{i_r}$$

$$\begin{array}{c|ccc}
R_i & x_j & x_k \\
0 & 1 \\
1 & 0
\end{array}$$

SQ (~

Soft constraints

• A soft constraint C_i^s is a function F_i that maps every possible joint assignment of all variables in the scope to a real value.

$$F_i: D_{i_1} \times \ldots \times D_{i_r} \to \mathfrak{R}$$

F _i	Xj	X _k
2	0	0
0	0	1
0	1	0
1	1	1

Chapter 12: Distributed Constraint Handling and Optimization

 $\mathcal{A} \mathcal{A} \mathcal{A}$

Different objectives, different problems

Constraint Satisfaction Problem (CSP)

• Objective: find an assignment for all the variables in the network that satisfies all constraints.

Constraint Optimization Problem (COP)

- Objective: find an assignment for all the variables in the network that satisfies all constraints and optimizes a global function.
- Global function = aggregation (typically sum) of local functions. $F(x) = \sum_{i} F_{i}(x_{i})$

₽.

 $\mathcal{A} \mathcal{A} \mathcal{A}$

Distributed Constraint Reasoning

When operating in a decentralized context:

- a set of agents control variables
- agents interact to find a solution to the constraint network

Distributed Constraint Reasoning

Two types of decentralized problems:

- o distributed CSP (DCSP)
- distributed COP (DCOP)

Here, we focus on DCOPs.

E.

SQ P

Distributed Constraint Optimization Problem (DCOP)

A DCOP consists of a constraint network $\mathcal{N} = \langle X, D, C \rangle$ and a set of agents $A = \{A_1, \dots, A_k\}$ where each agent:

- controls a subset of the variables $X_i \subseteq X$
- is only aware of constraints that involve variable it controls
- communicates only with its neighbours

SQ (V

Distributed Constraint Optimization Problem (DCOP)

- Agents are assumed to be fully cooperative
 - Goal: find the assignment that optimizes the global function, not their local local utilities.
- Solving a COP is NP-Hard and DCOP is as hard as COP.

SQ (~

Graph coloring Meeting Scheduling Target Tracking

Graph coloring

- Popular benchmark
- Simple formulation
- Complexity controlled with few parameters:
 - Number of available colors
 - Number of nodes
 - Density (*#nodes*/*#constraints*)
- Many versions of the problem:
 - CSP, MaxCSP, COP

<ロ > < 同 > < 巨 > < 巨 > 、

3

 $\mathcal{A} \mathcal{A} \mathcal{A}$

Graph coloring Meeting Scheduling Target Tracking

Graph coloring - CSP

- Nodes can take k colors
- Any two adjacent nodes should have different colors
 - If it happens this is a conflict

Graph coloring Meeting Scheduling Target Tracking

DCOP formalization for the target tracking problem

- Agents represent sensors
- Variables encode the different sensing modalities of each sensor
- Constraints
 - relate to a specific target
 - represent how sensor modalities impacts on the tracking performance
- Objective:
 - Maximize coverage of the environment
 - Provide accurate estimations of potentially dangerous targets

Local greedy methods: DSA-1, MGM-1 (Heuristic) GDL-based approaches: Max-Sum (Heuristic) Quality guarantees: k-optimality, region optimality, bounded Max-Sum

Why Approximate Algorithms

"Very often optimality in practical applications is not achievable"

Approximate algorithms

- Sacrify optimality in favor of computational and communication efficiency
- Well-suited for large scale distributed applications:
 - sensor networks
 - mobile robots

<ロ > < 同 > < 三 > < 三 > <

Э.

SQ Q

Local greedy methods: DSA-1, MGM-1 (Heuristic) GDL-based approaches: Max-Sum (Heuristic) Quality guarantees: k-optimality, region optimality, bounded Max-Sum

Centralized Local Greedy approaches

- Start from a random assignment for all the variables
- Do local moves if the new assignment improves the value (local gain)
- Local: changing the value of a small set of variables (in most case just one)
- The search stops when there is no local move that provides a positive gain, i.e., when the process reaches a local maximum.

SQ Q

Local greedy methods: DSA-1, MGM-1 (Heuristic) GDL-based approaches: Max-Sum (Heuristic) Quality guarantees: k-optimality, region optimality, bounded Max-Sum

Distributed Local Greedy approaches

When operating in a decentralized context:

- Problem: Out-of-date local knowledge
 - Assumption that other agents do not change their values
 - A greedy local move might be harmful/useless
- Solution:
 - Stochasticity on the decision to perform a move (DSA)
 - Coordination among neighbours on who is the agent that should move (MGM)

<ロ > < 同 > < 三 > < 三 > <

Э.

SQ P

Local greedy methods: DSA-1, MGM-1 (Heuristic) GDL-based approaches: Max-Sum (Heuristic) Quality guarantees: k-optimality, region optimality, bounded Max-Sum

Decentralised greedy approaches

- Very little memory and computation
- Anytime behaviours
- Could result in very bad solutions
 - local maxima arbitrarily far from optimal

Local greedy methods: DSA-1, MGM-1 (Heuristic) GDL-based approaches: Max-Sum (Heuristic) Quality guarantees: k-optimality, region optimality, bounded Max-Sum

Quality guarantees

So far, algorithms presented (DSA-1, MGM-1, Max-Sum) do not provide any guarantee on the quality of their solutions

- Quality highly dependent on many factors which cannot always be properly assessed before deploying the system.
- Particularly adverse behaviour on specific pathological instances.

Challenge:

• Quality assessment on approximate algorithms

Э.

SQ P

Algorithms

- Bounded Max-Sum
